

# Project Poster Instructions

## BSTA 512/612

### ! Important

Instructions and rubric are still in progress!

---

These instructions were partially developed using ChatGPT by feeding in my previous project report instructions and asking ChatGPT to edit for a poster.

### Directions

#### ! Project template

You *may* use [this project template](#) to get started on the report. It is your responsibility to meet the formatting guidelines below!!

DO NOT USE SITE PAGE (“Project Report Instructions”, current page) as your template!!

### Purpose

A scientific poster serves as a visual and concise way to communicate research findings. For this project, your poster should highlight your linear regression analysis and results while ensuring the context and methods are clearly explained. Posters should balance visuals (e.g., tables, figures) with text to engage an audience effectively.

## Formatting guide

- The report will be written in Quarto. Turn in both the `qmd` and `html` files
  - **No code** should appear in the `html` document
    - \* This means all R code chunks should have `#| echo: false`
    - \* This also means warnings and messages should be turned off
- The report should be 10 - 14 paragraphs long
- Tables and figures should NOT have variable names as they appear in the data frame
  - Variable names should be understood by a reader
  - Variable names should be written in full words
  - Include a title or caption for all figures
  - Figure and tables appear on same page or close to same page where they are first referenced
  - Tables and figures are an appropriate size in the html - Nicky is able to read all words in figures and tables
- Writing, spelling, and grammar should be admissable
  - This means I can generally follow your thought/what you are trying to communicate
  - Some spelling and grammar mistakes are allowed
    - \* I will not take off points if there are a few sprinkled in
    - \* If *every* or *close to every* sentence has mistakes, then I will take off
- Sectioning of the report
  - Main sections that were required: Introduction, Statistical Methods, Results, Discussion, Conclusion, and References
  - Other sections that might help group specific methods or results
- Title information at the top of the `html`
  - This includes the title itself, your name, and the date

**i** The project report is a separate file from the labs

You can save tables and figures from labs or separate files, then load them in the report

- Save R objects in analyses file:
  - Suppose you named the Table 1 as `table1`
  - `save(table1, file = "table1.Rdata")`
- Load R objects in report file: `load(file = "table1.Rdata")`

## Examples of reports

The following are examples of reports from BSTA 513 with the feedback that I gave them.

Please note that 513 uses a different type of outcome than our class. These examples are meant to help guide you with the formatting and some appropriate content.

Also note that these were converted to PDFs so I could write in feedback. Some of the tables and figure sizes were distorted. They need to be legible in the `html`.

- [Report 1 with my feedback](#)
- [Report 2 with my feedback](#)

The above reports have code showing in their `html`. Remember that I am asking you to **hide** all code, warnings, and messages.

## Grading

The project report is out of 36 points. Note that the Statistical Methods and Results sections are graded on an 8-point scale, while all other components are graded on a 4-point scale.

## Rubric

	4 points	3 points	2 points	1 point	0 points
Formating	Lab submitted on Sakai (or by email if late) with <code>.html</code> file. Report is written in complete sentences with very few grammatical or spelling errors. With little editing, the report can be distributed.	Lab submitted on Sakai (or by email if late) with <code>.html</code> file. Report is written in complete sentences with some (around 2 per section) grammatical or spelling errors. With some editing, the report can be distributed.	Lab submitted on Sakai (or by email if late) with <code>.html</code> file. Report is written in complete sentences, but have many grammatical or spelling errors. With major editing, the report can be distributed.	Lab submitted on Sakai (or by email if late) with <code>.html</code> file. Report is written in complete sentences, but are very hard to follow due to grammar mistakes.	Lab not submitted on Sakai (or by email if late) with <code>.html</code> file. Report is not written with complete sentences. With major editing, the report can be distributed.
Figure and output is displayed, including 2 required figures and tables, and at least one additional figure. Figures and tables look professional, are easily interpreted by the reader, and easily convey the intended message.	All requested output is displayed, including 2 required figures and tables, and at least one additional figure. For the most part, figures and tables look professional, are easily interpreted by the reader, and easily convey the intended message. A few mistakes in the figures are made.	All requested output is displayed, including 2 required figures and tables, and at least one additional figure. Figures and tables look semi-professional, are not so easily interpreted by the reader, and convey the intended message but after some work by the reader. Some mistakes in the figures are made.	All requested output is displayed, including 2 required figures and tables, and at least one additional figure. Figures and tables do not look professional, are not easily interpreted by the reader, and/or do not convey the intended message. Many mistakes in the figures are made.	Requested output is not displayed, Missing one or more figures.	

	4 points	3 points	2 points	1 point	0 points
Introduction (8 points)	Provides a good background for the research question, includes motivation for the question, and references previous research that justifies this analysis.	Provides a decent background for the research question and includes motivation for the question. Previous research is mentioned, but feels disconnected to the current analysis.	Provides a decent background for the research question and includes motivation for the question. Previous research is mentioned, but feels disconnected to the current analysis.	Does not provide a background that connects to the research question. Motivation and previous research are not mentioned.	No introduction included.
Methods (8 points)	Describes statistical methods concisely and highlights pertinent information to the reader (listed Sections below). Demonstrates proper analyses were performed.	Describes statistical methods and highlights pertinent information to the reader (listed Sections below). Details were omitted or added that were not needed to explain the overarching methods. Demonstrates proper analyses were performed.	Describes statistical methods and highlights pertinent information to the reader (listed Sections below). Details were omitted or added that were not needed to explain the overarching methods. Some incorrect analyses included in the description.	Describes statistical methods, but lacks clarity. Demonstrates a lack of understanding about the overall process of regression analysis. Incorrect analyses included in the description.	No methods included.

	4 points	3 points	2 points	1 point	0 points
Results (8 points)	Correctly interprets coefficients for the explanatory variable and identifies any other interesting trends. Highlights pertinent results to the reader (listed Sections below).	Correctly interprets coefficients, but does not correctly incorporate the interaction (if in the model). Highlights pertinent results to the reader (listed Sections below).	Incorrectly interprets coefficients. Highlights pertinent results to the reader (listed Sections below).	Incorrectly interprets coefficients. Omits pertinent results to the reader (listed Sections below).	No results included.
Discussion	Thoroughly and concisely discusses limitations and considerations of the results, and their consequences.	Discusses limitations and considerations of the results and their consequences, but misses some big considerations.	Discusses limitations and considerations of the results, but does not discuss the consequences.	Discusses limitations and considerations of the results, but misses many considerations and does not discuss consequences.	No discussion included.

4 points	3 points	2 points	1 point	0 points
For the conclusion, main research question is answered and statistical caveats described to non-technical person. References are mostly cited consistently within the report, and in the Reference section. This includes the data source!	For the conclusion, main research question is answered and statistical caveats described to non-technical person. References are sometimes cited consistently within the report, and in the Reference section. This includes the data source!	For the conclusion, main research question is somewhat answered (but focus is not on the research question) and statistical caveats described to non-technical person. References are sometimes cited consistently within the report, and in the Reference section. This includes the data source!	For the conclusion, main research question is somewhat answered (but not the focus at all) and statistical caveats are not described. References are not cited consistently within the report, and in the Reference section. This includes the data source!	For the conclusion, main research question is not answered. Or references are not included at all.

- In formatting, an example of a report with little editing needed is one that has zero to some grammar or spelling mistakes, no code chunks showing, and no output warnings nor messages showing.
- Professional figures mean
  - I can read the words and numbers in the html
    - \* Variable names are converted from the data frame version to readable text
    - \* For example: `iam_001` does not show up on axes, instead something like: **Response to "Currently, I am..."**
  - Colors are only used if conveying information
  - Intended message of the figure is easily understood
    - \* If you are trying to show a trend of mean IAT vs. an ordered categorical variable, then the variable is ordered on the x-axis
- For the references
  - I will not be overly critical about the formatting

- By consistency, I mean that you if you are citing things like (Last Name, Year) it doesn't suddenly change to number citations.
- If you would like to use Quarto's citation tool, you can! I actually pair it with Zotero and it works beautifully! (But I would not embark on this if you haven't used Zotero before)

## Sections

### Title

- **Purpose:** Create an identifiable name for your research project that includes the main research question's variables and gives some context to the analysis or results

### Introduction

- **Length: 5-8 bullets**
- **Purpose:** Introduce the research question and why it is important to study
- This section is non-technical.
  - By reading just the introduction and conclusion, someone without a technical background should have an idea of what they study was about, why it is important, and what the main results are
- You may start with your bullets from Lab 1, but you should edit it and make sure it flows into your report well!
- Should contain some references

### Methods

- **Length: 8-10 bullets**
- **Purpose:** Describe the analyses that were conducted and methods used to select variables and check diagnostics
- **Important to keep in mind:** methods typically describe your approach and process, not the results of that process
  - For example: I might say "We investigated the linearity of each continuous covariate visually. If continuous variables were not linear, then we divided the variable into categories using existing guidelines from <insert reference here> or creating quartiles."

- \* In the methods section, I would NOT say: “We investigated the linearity of each continuous covariate visually. We found that age was not linearly related to IAT scores. Thus, we categorized age into the following groups: \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_.”
  - The last two sentences about age would be more appropriate in the Results section
- **Some important methods to discuss** (You may divide these into your sections, not necessarily with these names)
  - General approach to the dataset
    - \* 2-3 bullets
    - \* Did you need to do any quality control?
    - \* Missing data: we performed complete case analysis
      - 1 sentence
      - Can be included in the Exploratory data analysis section
  - Variables and variable creation
    - \* This includes a description of analyses for Table 1 and what statistics were used to summarize the variables
      - More on creation of Table 1, not discussing the results of Table 1
    - \* Includes (not required)
      - Indicators for gender identity or race
      - Creating BMI
      - Categorizing a continuous variable (even if performed in model selection)
      - Using scoring for an ordered categorical variable (that is not your explanatory variable)
    - \* 1-2 sentences per variable
  - Model building: we performed purposeful selection
    - \* 3-5 sentences
    - \* Includes
      - Describe purposeful selection: combining existing literature, clinical significance, and analysis
      - How did you build the model? Describe the process
      - Did you consider confounders and effect modifiers?
  - Model diagnostics
    - \* 2-5 sentences
    - \* Includes
      - Process of investigating model diagnostics
      - By the time you build the model, LINE assumptions should be met
      - If assumptions were not met, what process did you use to fix it?

## Results

- **Length:** ~3 paragraphs
- **Purpose:** Relay the results from our sample's analysis typically focusing on the numbers and interpretations
- Some important results to discuss (also could be sections)
  - Sample data set statistics (Table 1)
    - \* 3-5 sentences
    - \* Include a brief description of the sample's characteristics
    - \* Table 1 should be referenced and appear here!
  - Final model
    - \* 1-2 sentences
    - \* Describe final model (or models if comparing a few)
      - What variables were included in your final model?
      - What interactions with your explanatory variable did you include?
  - Interpret the model coefficients in the context of the research question
    - \* 1-2 paragraphs
    - \* Interpreting the explanatory variable's relationship with IAT score is the most important thing to report!!
      - When doing this, make sure you account for ALL interactions: If your explanatory variable has multiple interactions and you are trying to interpret one, then what does that mean about the other variables involved in the other interactions? If this is confusing, please make an appointment with me!!
  - Results of model diagnostics if there is anything worth noting
- Tables & figures
  - The following are required tables or figures
    - \* Table 1 summarizing participant characteristics both **overall** and **stratified by your primary independent variable**
    - \* Table or figure with regression results
      - Can be a forest plot
      - If you have A LOT of coefficient estimates, the forest plot may not work well!
  - **1-3 figures that you think are helpful in understanding the results, for example**
    - \* DAG explaining connection between variables (if you did this)
    - \* Table or figure to compare model fit statistics (if you did this)
    - \* Table or figure for unadjusted relationship between outcome and explanatory variables

## Discussion

- **Length: 2-3 paragraphs**
- **Purpose:** Discuss the results and give them context outside of the sample and its analysis
- Some important things to include
  - Include a paragraph on the limitations of the results
    - \* You don't need to hit all the limitations, but think about the big ones (generalizability? independence of samples? large sample size vs. clinical significance? the way we handled variables?)
  - After limitations, discuss the positive parts of the results
    - \* What can we do with these results? What impact can it have?
  - Any overarching trends that are worth noting? (Giebel et al. 2024)
- Should contain some references

## Conclusion

- **Length: 1 short paragraph (more like ~3 sentences)**
- **Purpose:** Describe the main conclusions to a non-technical audience

## References

- Include your references here!
- Your introduction should have references, especially when discussing the social science behind the analysis
- You must reference the IAT data source!!

Giebel, Clarissa, Mark Gabbay, Nipun Shrestha, Gabriel Saldarriaga, Siobhan Reilly, Ross White, Ginger Liu, Dawn Allen, and Maria Isabel Zuluaga. 2024. "Community-Based Mental Health Interventions in Low- and Middle-Income Countries: A Qualitative Study with International Experts." *International Journal for Equity in Health* 23 (1). <https://doi.org/10.1186/s12939-024-02106-6>.
